

# How To Install Xibo On Windows Xampp PHP 7.4.27

1. Download xampp 7.4.27 application at this link : <https://sourceforge.net/projects/xampp/files/XAMPP%20Windows/7.4.27/> and save it in a folder named XAMPP (XAMPP folder)
2. Download xibo app (version 3.3.5) at this link : <https://xibosignage.com/blog/3-3-5-released> and save it in a folder with the name XIBO (XIBO folder)
3. Download ZeroMQ at this link : <https://github.com/zeromq/php-zmq/files/4397645/php-7.4.4-zmq-1.1.4-4.3.2-x64-vc15-zts-nts.zip>
4. Download fastcgi application at this link: <https://www.apachelounge.com/download/> , select the mod\_fcgid-2.3.10-Win64-vs17.zip file for Windows 64 bit
5. Install the xampp file that was downloaded previously
6. Open xampp control panel, click config tab then click apache and mysql in the autostart of modules section then click save after that close the xampp control panel application
7. Extract the downloaded ZeroMQ file and install ZeroMQ in the Xampp application as follows:
  - A. Select php\_zmq\_zts.dll file then copy the file in the folder path C:\xampp\php\ext
  - B. Select the file libzmq-v141-mt-4\_3\_2.dll then copy the file in the folder path C:\xampp\php
  - C. Then open the php file.ini (C:\xampp\php) and look for the Dynamic Extension sentence (press the control key and F key at the same time then type Dynamic Extension). After the word Dynamic Extension has been found then under the sentence type extension=php\_zmq\_zts.dll (see image below):

```
php.ini - Editor
Datei Bearbeiten Format Ansicht ?
;;;;;;;;;;;;;;;;;;;;;;;;;;;;;
; Dynamic Extensions ;
;;;;;;;;;;;;;;;;;;;;;;;;;;;;;

; If you wish to have an extension loaded automatically, use the following
; syntax:
;
; extension=modulename.extension
;
; For example, on Windows:
;
; extension=mysqli.dll
;
; ... or under UNIX:
;
; extension=mysqli.so
;
; ... or with a path:
;
; extension=/path/to/extension/mysqli.so
;
; If you only provide the name of the extension, PHP will look for it in its
; default extension directory.
;
; Windows Extensions
; Note that ODBC support is built in, so no dll is needed for it.
; Note that many DLL files are located in the extensions/ (PHP 4) ext/ (PHP 5)
; extension folders as well as the separate PECL DLL download (PHP 5).
; Be sure to appropriately set the extension_dir directive.
;
extension=php_zmq_zts.dll
extension=php_bz2.dll
extension=php_curl.dll
extension=php_fileinfo.dll
extension=php_gd2.dll
extension=php_gettext.dll
```

then save the file (don't select Save As)

D. Then open the httpd.conf file (C:\xampp\apache\conf) then edit this file as shown below:

```
httpd.conf - Editor
Datei Bearbeiten Format Ansicht ?
# Listen: Allows you to bind Apache to specific IP addresses and/or
# ports, instead of the default. See also the <VirtualHost>
# directive.
#
# Change this to Listen on specific IP addresses as shown below to
# prevent Apache from glomming onto all bound IP addresses.
#
#Listen 12.34.56.78:80
Listen 80

#
# Dynamic Shared Object (DSO) Support
#
# To be able to use the functionality of a module which was built as a DSO you
# have to place corresponding 'LoadModule' lines at this location so the
# directives contained in it are actually available _before_ they are used.
# Statically compiled modules (those listed by 'httpd -l') do not need
# to be loaded here.
#
# Example:
# LoadModule foo_module modules/mod_foo.so
#
LoadFile "C:\xampp\php\libzmq-v141-mt-4_3_2.dll"
LoadModule access_compat_module modules/mod_access_compat.so
LoadModule actions_module modules/mod_actions.so
LoadModule alias_module modules/mod_alias.so
LoadModule allowmethods_module modules/mod_allowmethods.so
LoadModule asis_module modules/mod_asis.so
```

then save the file (don't select Save As)

E. Extract the downloaded mod\_fcgid-2.3.10-win64-vs17.zip file and copy mod\_fcgid.so file to C:\xampp\apache\modules

F. Then edit the httpd-xampp.conf file (C:\xampp\apache\conf\extra). Delete the part in the httpd-xampp.conf file as shown below:

```
#
# PHP-Module setup
#
LoadFile "C:/xampp/php/php7ts.dll"
LoadFile "C:/xampp/php/libpq.dll"
LoadFile "C:/xampp/php/libsqlite3.dll"
LoadModule php7_module "C:/Apps/xampp/php/php7apache2_4.dll"

<FilesMatch "\.php$" >
    SetHandler application/x-httpd-php
</FilesMatch>
<FilesMatch "\.phps$" >
    SetHandler application/x-httpd-php-source
</FilesMatch>
```

then replace the section as shown above with the image below:

```
#  
# PHP-Module setup  
#  
LoadFile "C:/xampp/php/php7ts.dll"  
LoadFile "C:/xampp/php/libpq.dll"  
LoadFile "C:/xampp/php/libsqlite3.dll"  
  
LoadModule fcgid_module modules/mod_fcgid.so  
  
<IfModule fcgid_module>  
    FcgidInitialEnv PATH "C:/xampp/php"  
    FcgidInitialEnv SystemRoot "C:/Windows"  
    FcgidInitialEnv SystemDrive "C:"  
    FcgidInitialEnv TEMP "C:/xampp/tmp"  
    FcgidInitialEnv TMP "C:/xampp/tmp"  
    FcgidInitialEnv windir "C:/windows"  
    FcgidIOTimeout 64  
    FcgidConnectTimeout 16  
    FcgidMaxRequestsPerProcess 1000  
    FcgidMaxProcesses 3  
    FcgidMaxRequestLen 2147483648  
    # Location php.ini:  
    FcgidInitialEnv PHPRC "C:/xampp/php"  
    FcgidInitialEnv PHP_FCGI_MAX_REQUESTS 1000  
  
    <Files ~ "\.php$" >  
        Options Indexes FollowSymLinks ExecCGI  
        AddHandler fcgid-script .php  
        FcgidWrapper "C:/xampp/php/php-cgi.exe" .php  
    </Files>  
</IfModule>
```

E. Still in the httpd-xampp.conf file above, add it like this:

```
# add this option allow FastCGI
```

```
Options ExecCGI
```

in the php MyAdmin section as shown below:

```
Alias /phpmyadmin "C:/xampp/phpMyAdmin/"
<Directory "C:/xampp/phpMyAdmin">

    # add this option allow FastCGI
    Options ExecCGI

    AllowOverride AuthConfig
    Require local
    ErrorDocument 403 /error/XAMPP_FORBIDDEN.html.var
</Directory>
```

then save the file (don't select Save As)

8. Copy the xibo file (version 3.3.5) in C:\xampp\htdocs then extract the file in the folder path mentioned
9. Then rename the folder extracted from the xibo file above to xibo
10. Open the php.ini file in the folder path C:\xampp\php then edit the file as shown below:

```
; The MIBS data available in the PHP distribution must be installed.
; See http://www.php.net/manual/en/snmp.installation.php
;extension=snmp
```

```
extension=soap
;extension=sockets
;extension=sodium
;extension=sqlite3
;extension=tidy
;extension=xmlrpc
;extension=xsl
```

```
; Maximum size of POST data that PHP will accept.
; Its value may be 0 to disable the limit. It is ignored if POST data reading
; is disabled through enable_post_data_reading.
; http://php.net/post-max-size
post_max_size=128M
```

**; Maximum execution time of each script, in seconds**  
**; http://php.net/max-execution-time**  
**; Note: This directive is hardcoded to 0 for the CLI SAPI**  
**max\_execution\_time=120**

11. Then open xampp control panel
12. Open a browser (edge or mozilla) and type <https://localhost/xibo/web/install/index.php/1>
13. Then follow the installation procedure displayed in the installation process
14. After the installation is complete and xibo login is open, then do not log in first and close the browser
15. Open xampp control panel then stop Apache and MySQL operations but do not close xampp control panel
16. Open the index.php file in the folder path C:\xampp\htdocs
17. Then edit it as shown below:

```
<?php
    if (!empty($_SERVER['HTTPS']) && ('on' == $_SERVER['HTTPS'])) {
        $uri = 'https://';
    } else {
        $uri = 'http://';
    }
    $uri .= $_SERVER['HTTP_HOST'];
    header('Location: '.$uri.'/xibo/web/');
    exit;
?>
```

Something is wrong with the XAMPP installation :-{

then save the file (don't select Save As)

18. Open the httpd.conf file in the folder path C:\xampp\apache\conf then search for the word "documentroot" by pressing the control key and F key simultaneously then type documentroot then press enter. After finding the word, then change it as shown below:

```
#
# DocumentRoot: The directory out of which you will serve your
# documents. By default, all requests are taken from this directory, but
# symbolic links and aliases may be used to point to other locations.
#
DocumentRoot "C:/xampp/htdocs/xibo/web"
<Directory "C:/xampp/htdocs">
```

then save the file (don't select Save As)

19. Then open the sendmail file.ini in the folder path C:\xampp\sendmail, then edit the file as shown below:

```
; configuration for fake sendmail

; if this file doesn't exist, sendmail.exe will look for the settings in
; the registry, under HKLM\Software\Sendmail

[sendmail]

; you must change mail.mydomain.com to your smtp server,
; or to IIS's "pickup" directory. (generally C:\inetpub\mailroot\Pickup)
; emails delivered via IIS's pickup directory cause sendmail to
; run quicker, but you won't get error messages back to the calling
; application.

smtp_server=mail.example.com change this with your
smtp email you have

; smtp port (normally 25)

smtp_port=587

; SMTPS (SSL) support
; auto = use SSL for port 465, otherwise try to use TLS
; ssl = always use SSL
; tls = always use TLS
; none = never try to use SSL

smtp_ssl=tls

; the default domain for this server will be read from the registry
; this will be appended to email addresses when one isn't provided
; if you want to override the value in the registry, uncomment and modify

default_domain=mail.example.com Change this with your
smtp server email

; log smtp errors to error.log (defaults to same directory as sendmail.exe)
; uncomment to enable logging

error_logfile=error.log

; create debug log as debug.log (defaults to same directory as sendmail.exe)
; uncomment to enable debugging

debug_logfile=debug.log

; if your smtp server requires authentication, modify the following two lines

auth_username=
auth_password= Fill this with your email
username and password

; if your smtp server uses pop3 before smtp authentication, modify the
; following three lines. do not enable unless it is required.
```

```
pop3_server=  
pop3_username=  
pop3_password=
```

```
; force the sender to always be the following email address  
; this will only affect the "MAIL FROM" command, it won't modify  
; the "From: " header of the message content
```

```
force_sender= Fill this with your email
```

```
; force the sender to always be the following email address  
; this will only affect the "RCTP TO" command, it won't modify  
; the "To: " header of the message content
```

```
force_recipient=
```

```
; sendmail will use your hostname and your default_domain in the ehlo/helo  
; smtp greeting. you can manually set the ehlo/helo name if required
```

```
hostname=localhost
```

then save the file (don't select Save As)

20. Then open the php file.ini in the folder path C:\xampp\php then edit the file as shown below:

```
[mail function]  
; For Win32 only.  
; http://php.net/smtp  
SMTP=mail.example.com change this with your  
smtp email  
; http://php.net/smtp-port  
smtp_port=587  
  
; For Win32 only.  
; http://php.net/sendmail-from  
sendmail_from = Fill this with your email  
  
; For Unix only. You may supply arguments as well (default: "sendmail -t -i").  
; http://php.net/sendmail-path  
sendmail_path = "\"C:\xampp\sendmail\sendmail.exe\" -t"  
  
; Force the addition of the specified parameters to be passed as extra parameters  
; to the sendmail binary. These parameters will always replace the value of  
; the 5th parameter to mail().  
;mail.force_extra_parameters =
```

then save the file (don't select Save As)

21. Reopen the xampp control panel and re-enable Apache and MySQL

22. Reopen the browser and then type the ip address owned by the computer that has xampp and xibo installed

**23. Open notepad and create a file as follows:**

```
{  
  "listenOn": "tcp://127.0.0.1:5555",  
  "pubOn": ["tcp://*:9505"],  
  "debug": true  
}
```

then save the file with the name config.json then save the do path folder  
C:\xampp\htdocs\xibo\vendor\bin

**24. Open notepad, then create an email like the example below:**

```
<?php  
mail('youremail@gmail.com', 'Email Subject', 'This is a test');  
?>`
```

then save it with the name testemail.php and save it in the folder path C:\xampp\htdocs\Test.  
Previously you created a folder named Test in the folder path C:\xampp\htdocs

**25. Open Notepad again and type the formula as below:**

```
cd C:\xampp\htdocs\xibo\vendor\bin php xmr.phar
```

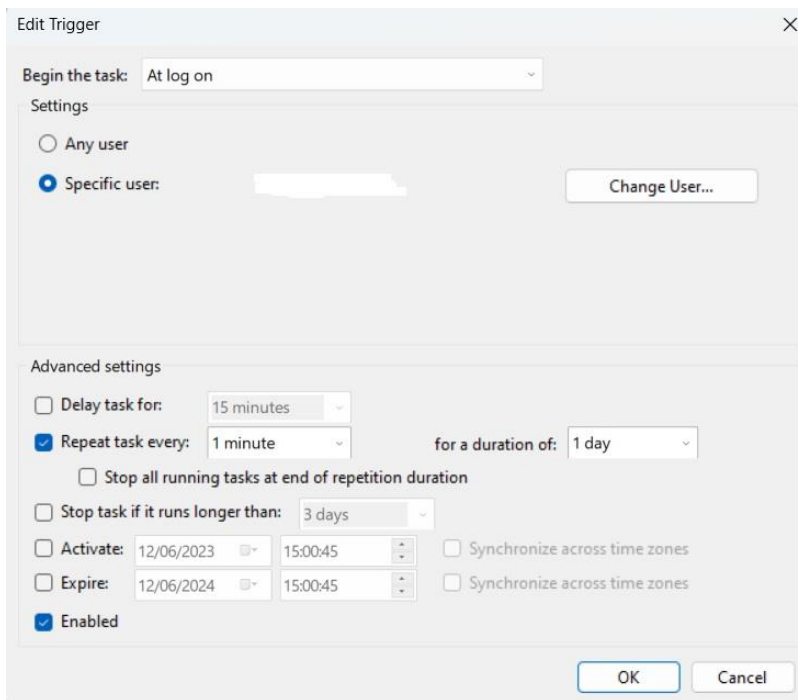

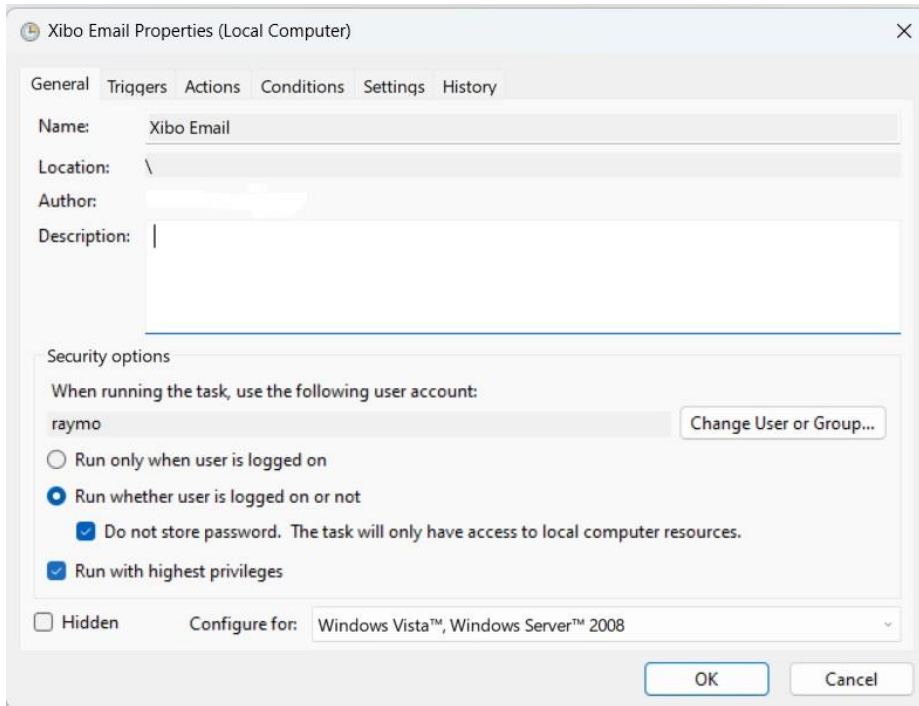

and then save as XMR.bat in folder path C:\xampp\htdocs\xibo

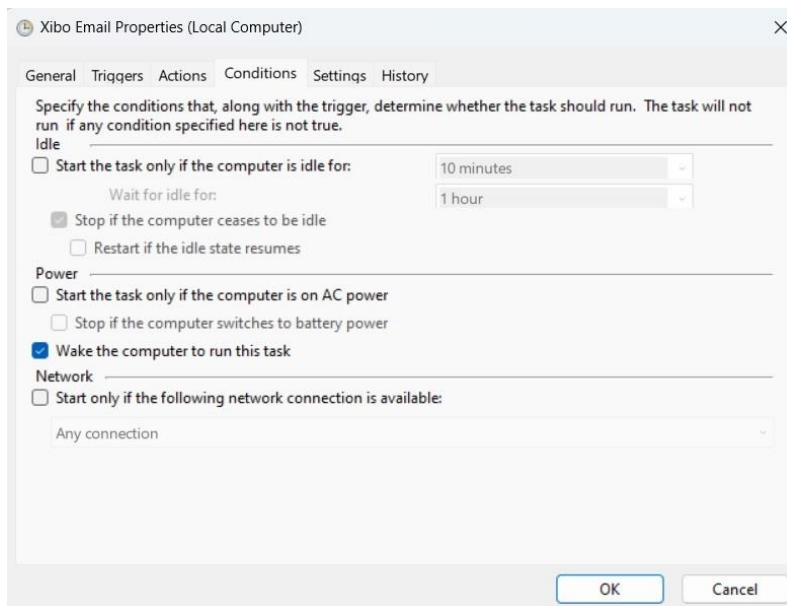

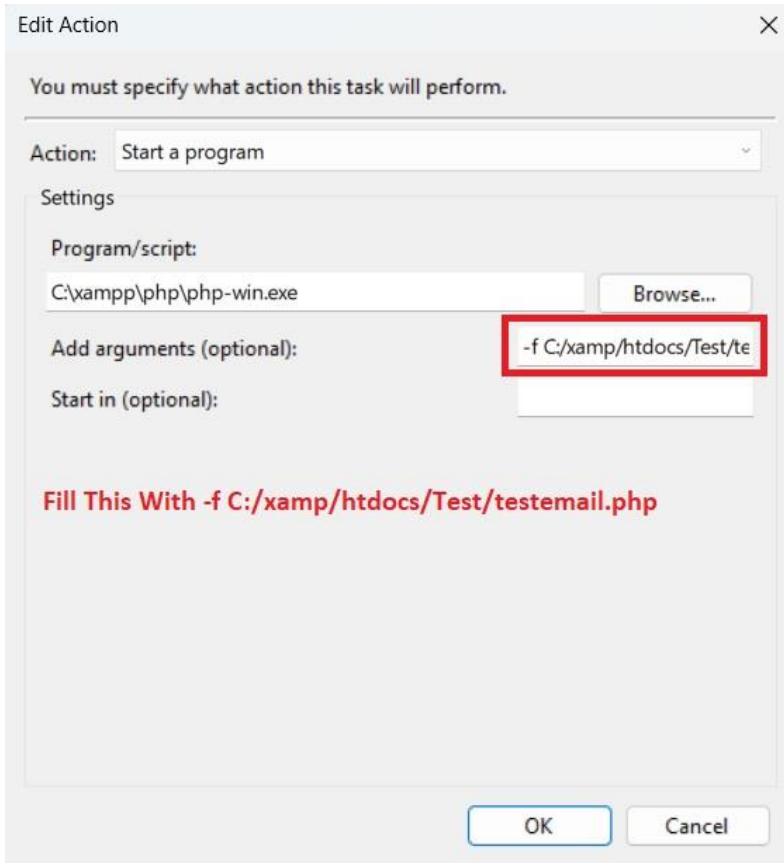

**26. Open Task Scheduler and create some task schedulers for Xibo as below:**

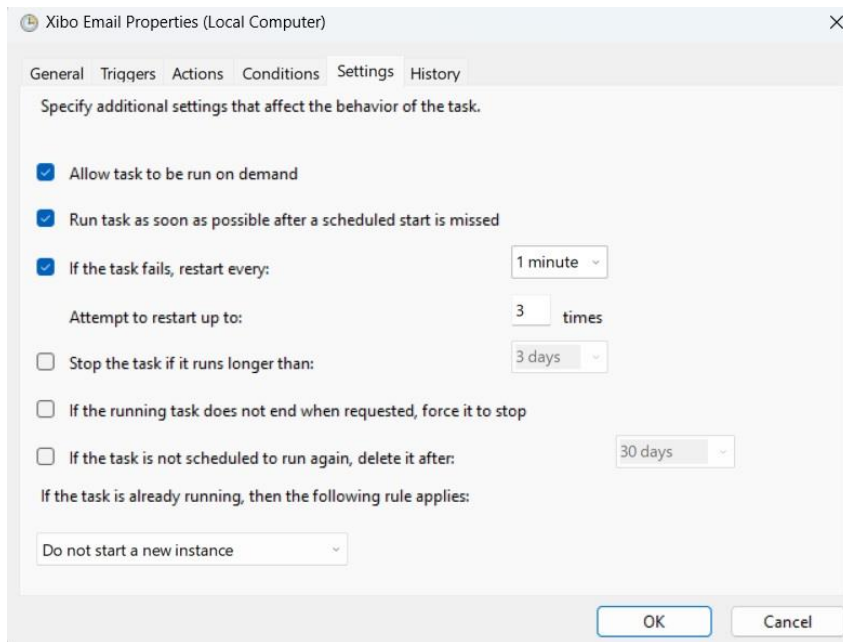

**A. Task Scheduler for Test Email**

See the pictures below:

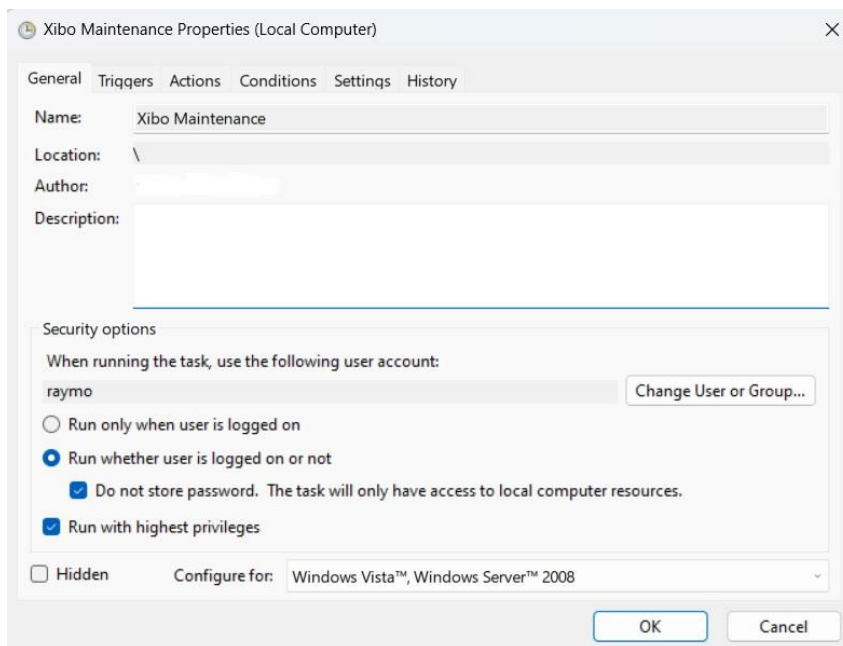

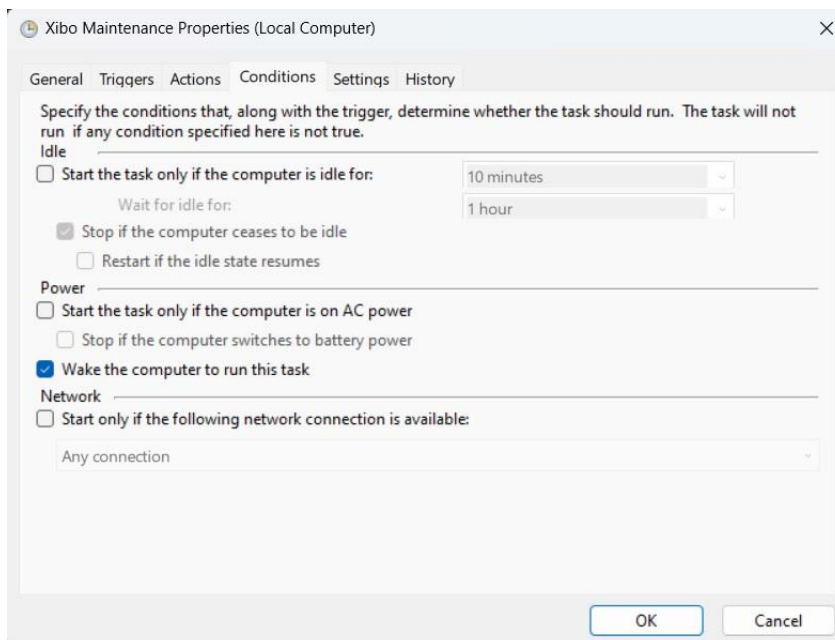

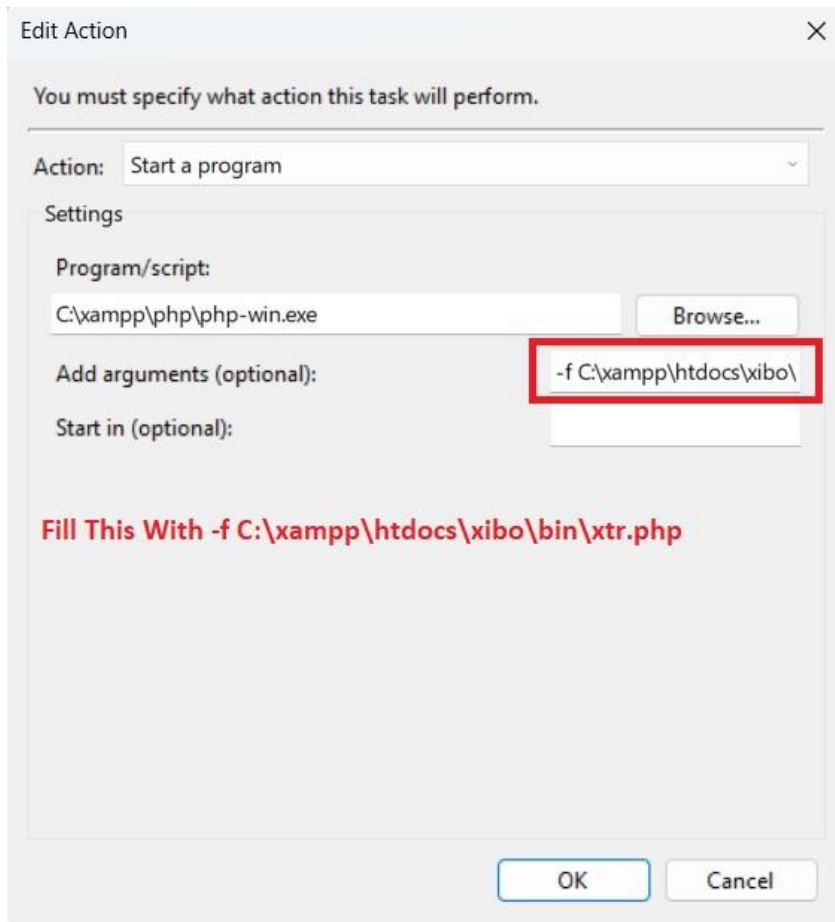

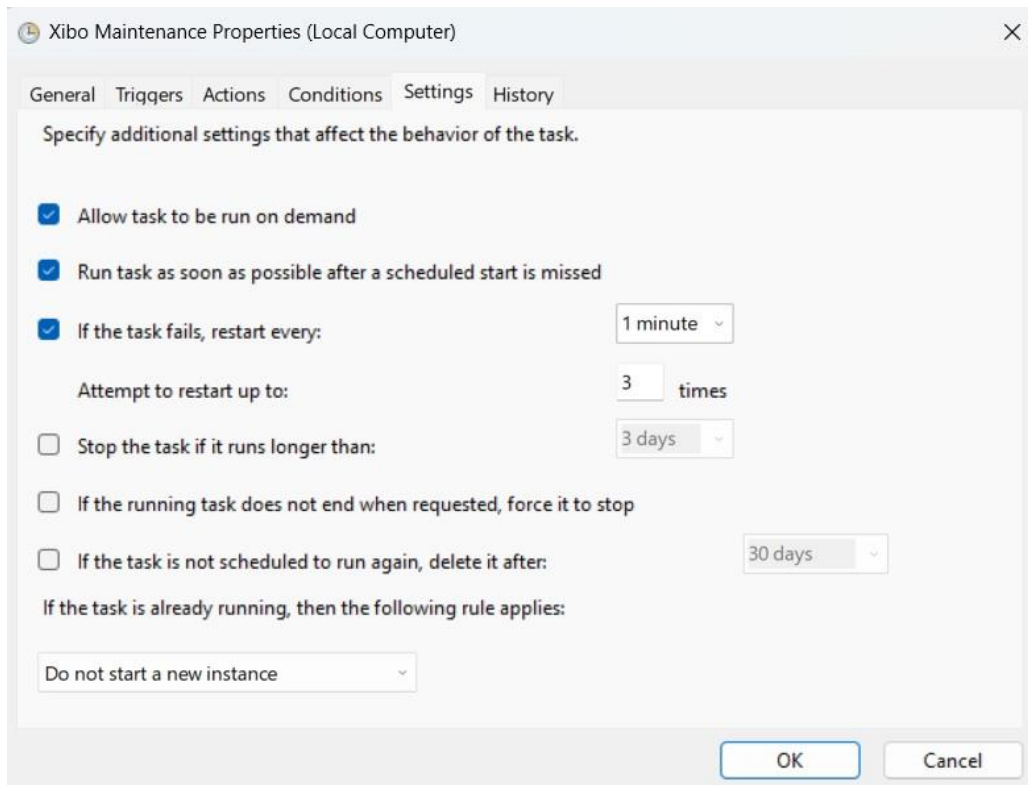

## B. Task Scheduler for xtr xibo

See the pictures below:

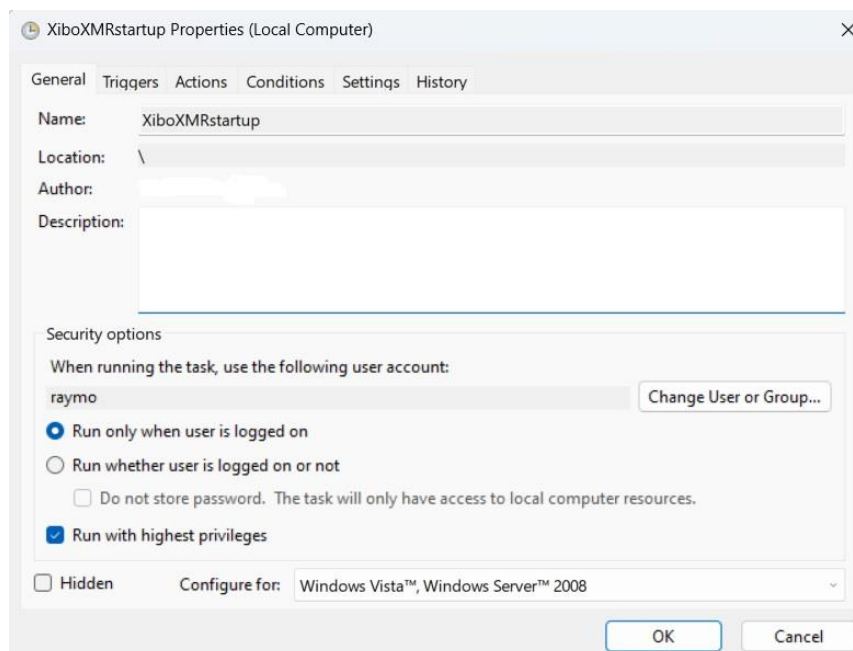

### C. Task Scheduler for startup xmr program in xibo

See the pictures below:

Edit Trigger

Begin the task: At log on

Settings

Any user

Specific user: [redacted] Change User...

Advanced settings

Delay task for: 15 minutes

Repeat task every: 3 minutes for a duration of: 1 day

Stop all running tasks at end of repetition duration

Stop task if it runs longer than: 3 days

Activate: 12/06/2023 17:15:16  Synchronize across time zones

Expire: 12/06/2024 17:15:16  Synchronize across time zones

Enabled

OK Cancel

Edit Action

You must specify what action this task will perform.

Action: Start a program

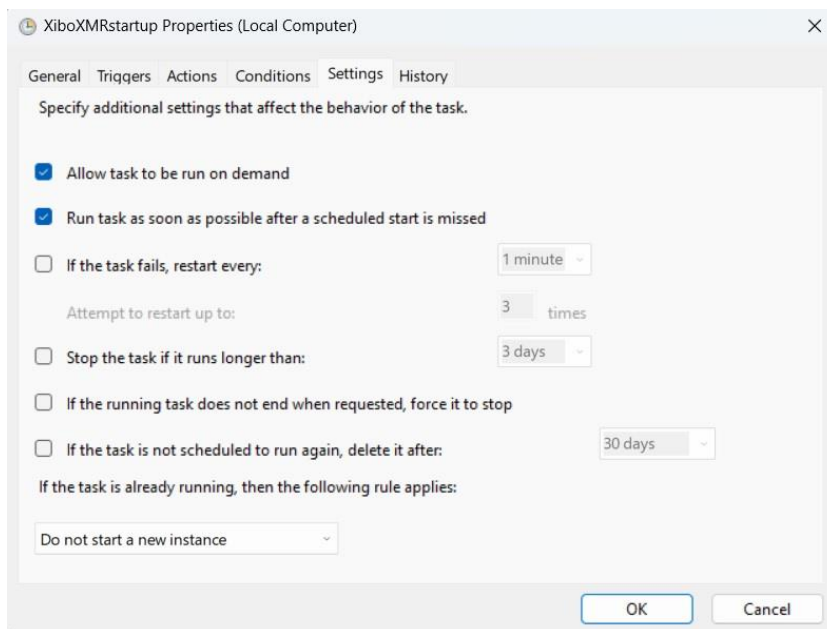

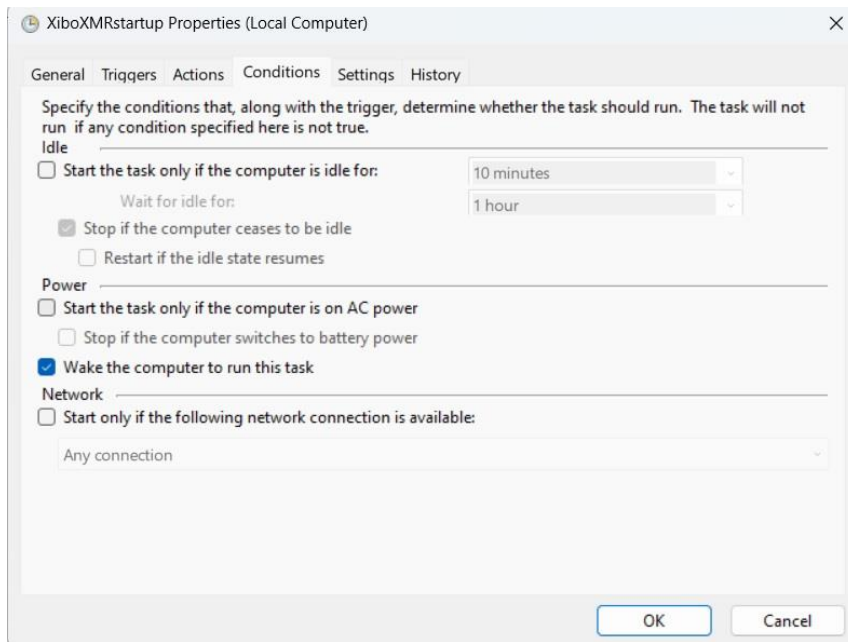

Settings

Program/script:  
C:\xampp\htdocs\xibo\XMR.bat Browse...

Add arguments (optional):

Start in (optional):

OK Cancel

**PS: If you want to call the xibo server in the browser by just typing the ip address, then you can follow the instructions number 17 and 18 above**
